How to build docker containers with GitHub and DockerHub

The following document requires an account at DockerHub and GitHub. This document explains the following:

- 1. How to fork the Apache Guacamole client and server repositories on $\operatorname{Git} \operatorname{Hub}$.
- 2. How to link your Github Account to your DockerHub account.
- 3. How to automate the build of docker containers from your Github Apache Guacamole server and client repositories.
- 1. Create an account on DockerHub http://hub.docker.com
- 2. Go to you Repositories

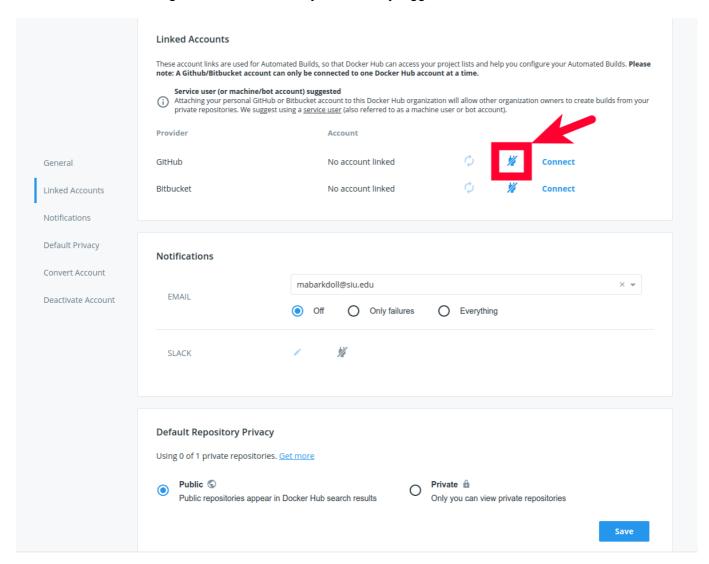

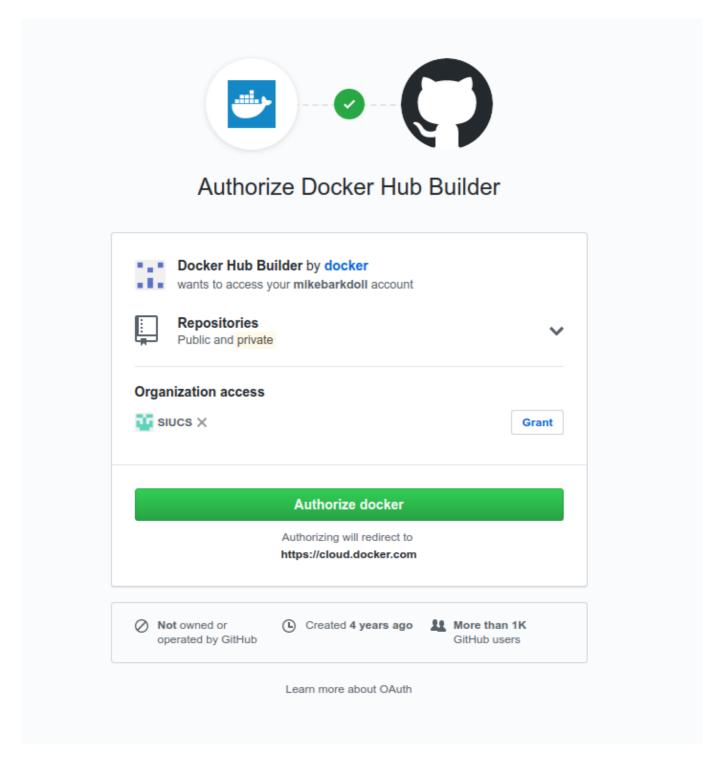

3. Click Account Settings

4. Under Account Settings, Go to Linked Accounts

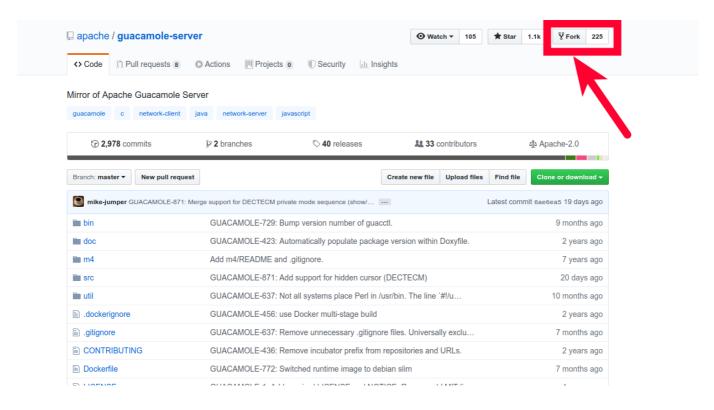

Click the Connection Plug to link DockerHub to your currently logged in GitHub Account.

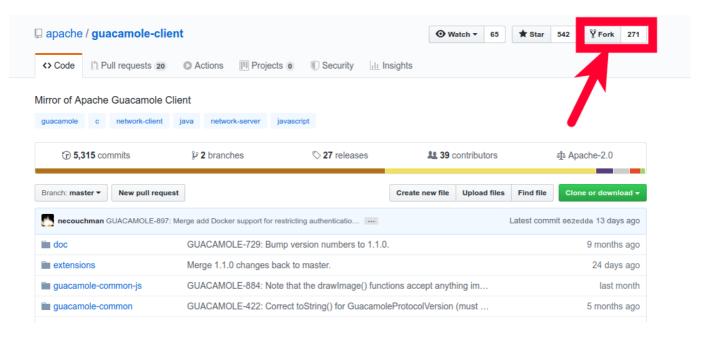

6. On GitHub Fork the apache guacamole repositories.

https://github.com/apache/guacamole-server

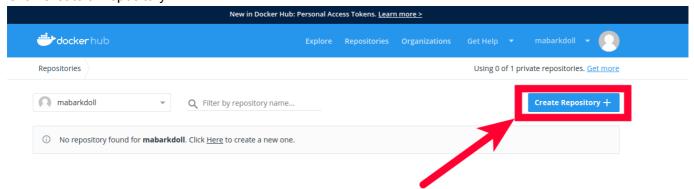

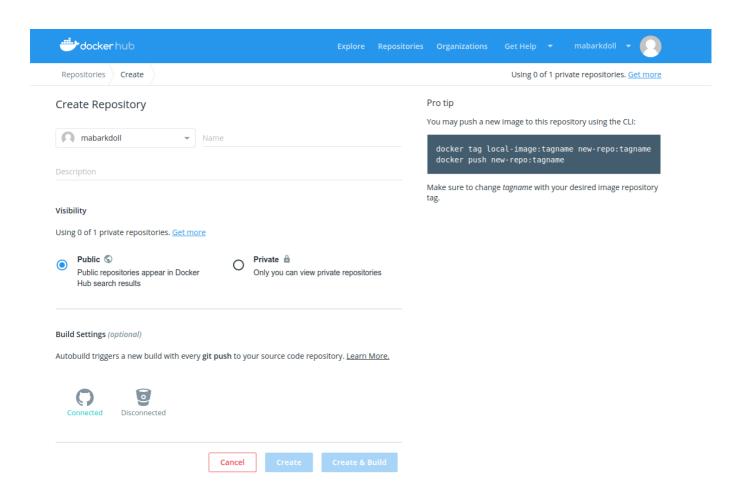

https://github.com/apache/guacamole-client

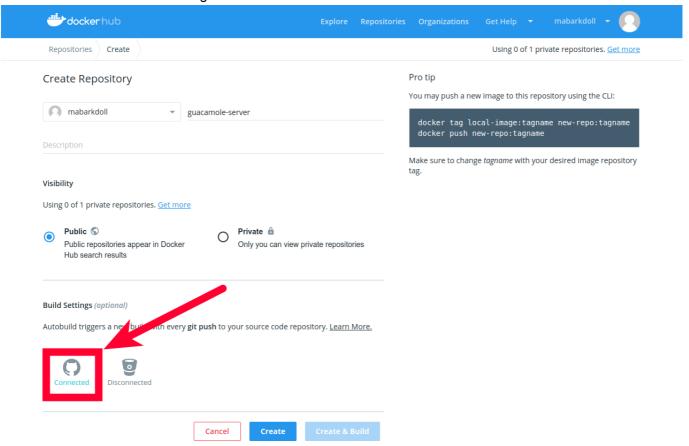

7. On DockerHub, Create the repository

Click Create a Repository

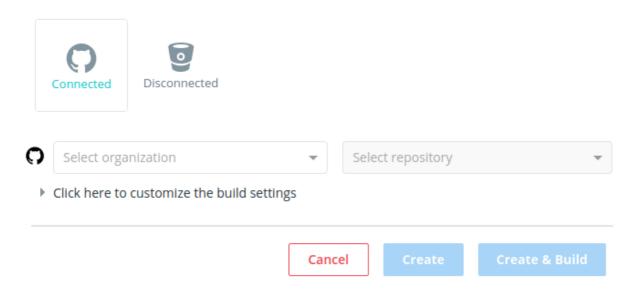

Select Github under Build Settings

Select your organization and forked github repository

Build Settings (optional)

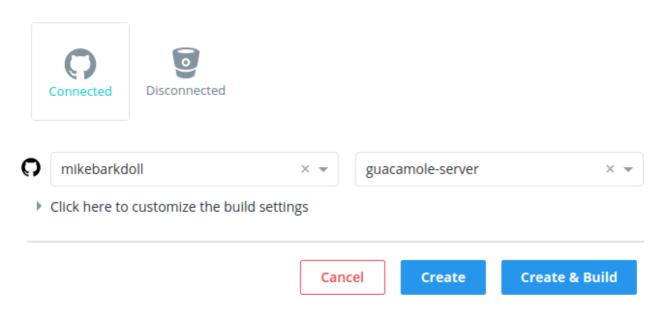

Autobuild triggers a new build with every git push to your source code repository. Learn More.

Select Click here to customize the build settings

Build Settings (optional)

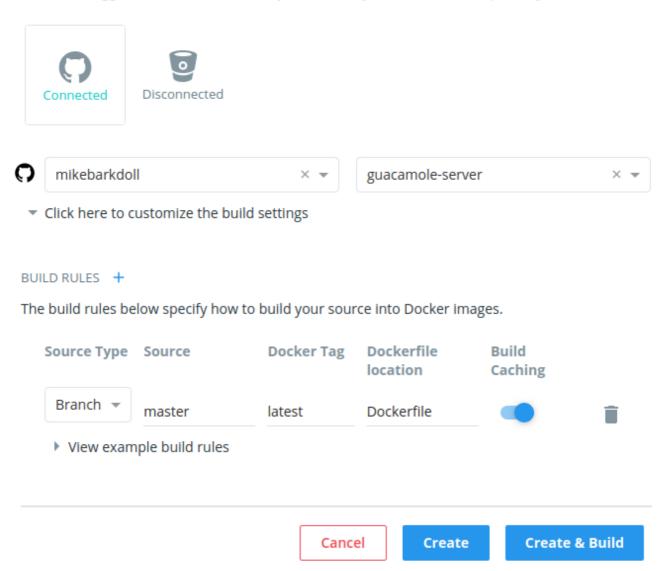

Autobuild triggers a new build with every git push to your source code repository. Learn More.

Confirm similar settings.

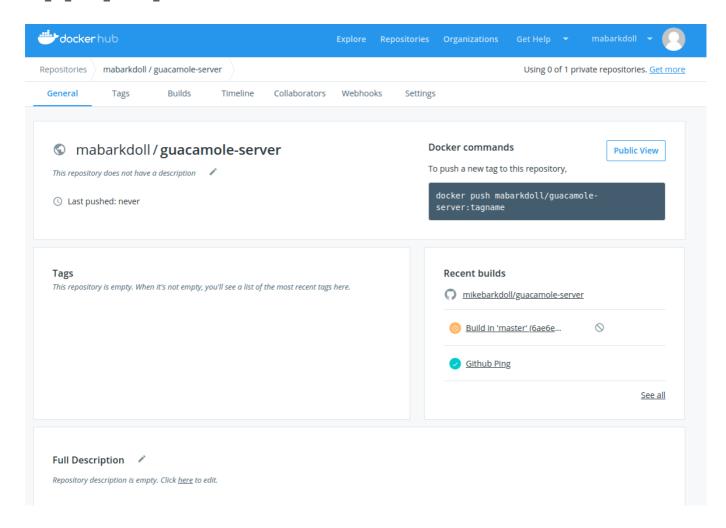

Build Settings (optional)

Autobuild triggers a new build with every git push to your source code repository. Learn More.

You'll need to perform this step for both guacamole-client and guacamole-server.

8. Select Create & Build
